Are you looking for the right sires to make cows that work in your robotic milking system? Look no further. We have developed a program to deliver offspring that will thrive in these modern environments. Of these 35 robot-suited sires, 19 have the coveted high fertility CONCEPT PLUS rating and the group of both daughter-proven and genomic-proven sires averages 2498 TPI and 692 NM\$! The robot-suited sires also have a variety of production, health and type levels to appeal to almost every unique genetic plan.

Alta's robotic-suited sires put emphasis on the important traits for cows that live and work in the robotic milking facilities. These traits include:

Rear Teat Placement (RTP) | Teat Length (TL) | Udder Depth (UD) | Rear Leg Rear View (RLRV)

We select for rear teat placement to make sure there will be adequate distance between the rear teats to allow for easier identification and unit attachment. Teat length has also become much shorter, so identifying longer teat length sires aids in the ease of unit attachment. Udder depth is emphasized to make sure there is enough clearance for the milking apparatus. In addition, we take milking speed into account to ensure all cows have adequate time to be milked as needed.

To ensure you have access to these sires, we have only included the robot-suited sires with plenty of inventory.
