DWP\$ (Dairy Wellness Profit \$) and **WT\$** (Wellness Trait \$) are genetic indexes calculated by Zoetis from producer-recorded data, in herds that are genomic testing or have genomic tested in the past.

HOW ARE THESE INDEXES COMPILED?

DWP\$ is a genetic selection index that equates to a genetic plan of 34% Production – 56% Health – 10% conformation. This differs from the overall NM\$ index (43-41-16), and the breakdown of the weight on health is different as well. DWP\$ puts 30% of the weight on WT\$, leaving 26% for the CDCB evaluated health traits of PL, DPR, SCS, DSB, DCE, CCR, HCR.

WT\$ is a combination of the Wellness Traits (Ketosis, Displaced Abomasum, Retained Placenta, Metritis, Mastitis and Lameness). This means it is an index that is analogous to a 0-100-0 index, with 100% weight on health traits – but those weights are divided between the various Wellness traits that Zoetis calculates.
